STABILITY INDICATING RP-HPLC METHOD FOR THE ESTIMATIONOF CLOFARABINE IN PARENTERAL FORMULATION

Foram Patel^{1*}, D. B.Joshi¹, P. Tiwari¹, R. S. Bhadauria¹

¹Department of pharmaceutical Chemistry, Shrinathji Institute of Pharmacy, Nathdwara, Dist-Rajsamand 313301(Rajasthan) INDIA

A Simple, accurate and precise Stability Indicating RP-HPLC method was developed for estimation of Clofarabine in Parenteral Formulation. Inertsil C₁₈ (150mm×4.6mm) 5 μ (particle size) was used as stationary phase. The mobile phase used was Buffer: Acetonitrile 90:10 v/v. The mobile phase was delivered at flow rate 1.0 ml/min. UV detection was set at 263nm. The retention time of Clofarabine was found to be 3.07 minutes. Linearity was observed over the concentration range of 5-25 μ g/ml for Clofarabine. Force degradation study was perform and maximum degradation of Standard and Test of Clofarabine was found to be 18.8% and 17.5% in Acidic condition. The LOD was found to be 0.071 μ g/ml for Clofarabine. Whereas LOQ was found to be 0.21 μ g/ml. Moreover, the % RSD for repeatability, inter and intraday precision was found to be less than 2%, which reveals that the method is precise. However, the change in flow rate and mobile phase ratio also did not show any significant variance. Assay of the dosage form finalized the applicability of this method for estimation of Clofarabine in Parenteral Formulation.

Key Words: Stability Indicating RP-HPLC method, Clofarabine, Parenteral Formulation, Force degradation study, % RSD.

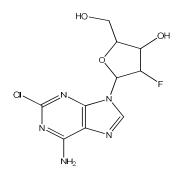

INTRODUCTION

Pharmaceutical products formulated with more than one drug, typically referred to as combination products. These combination products can present daunting challenges to the analytical chemist responsible for the development and validation of analytical methods. The development and validation of analytical methods [Spectrophotometric, High performance liquid chromatography (HPLC) & High performance thin layer chromatography (HPTLC)] for drug products containing more than one active ingredient. The official test methods that result from these processes are used by quality control laboratories to ensure the identity, purity, potency, and performance of drug products.

The number of drugs introduced into the www.pharmaerudition.org Aug 2019, 9 (2), 11-23

market is increasing every year. These drugs may be either new entities or partial structural modification of the existing ones. Very often there is a time lag from the date of introduction of a drug into the market to the date of its inclusion in pharmacopoeias. This happens because of the possible uncertainties in the continuous and wider usage of these drugs, reports of new toxicities (resulting in their withdrawal from the market), development of patient resistance and introduction of better drugs by competitors. Under these conditions, standards and analytical procedures for these may not be available in drugs the pharmacopoeias. It becomes necessary, therefore to develop newer analytical methods for such drugs.

DRUG PROFILE:

Clofarabine is a second generation purine nucleoside analog with antineoplastic activity. Clofarabine is phosphorylated intracellularly to the cytotoxic active 5'-triphosphate metabolite, which inhibits the enzymatic activities of ribonucleotidereductase and DNA polymerase, resulting in inhibition of DNA repair and synthesis of DNA and RNA. This nucleoside analog also disrupts mitochondrial function and membrane integrity, resulting in the release of pre-apoptotic factors, including cytochrome C and apoptotic-inducing factors, which activate apoptosis.

MATERIALS AND METHODS:

Sr. No	Chemicals	Specifications	Manufactures
1.	Clofarabine	Active Pharmaceutical	Sion pharmaceuticals Pvt Ltd
2.	Water	HPLC grade	Merck India
3.	Menthol	HPLC grade	Merck India
4.	Acetonitrile	HPLC grade	Spectochem
5.	Glacial acetic acid	HPLC grade	Merck India

Table 1: Reagents and Materials used

Selection of Chromatographic condition:

- Column: Inertsil C₁₈ (150mm×4.6mm)
 5µm
- Mobile Phase: Buffer : Acetonitrile (90:10)V/V
- Flow Rate: 1.0 ml/min
- Column Temperature: 40°C
- Detection Wavelength: 263 nm
- Run time: 10 min
- Injection volume: 5 µl

Selection of mobile phase:

- Buffer: 1ml Glacial acetic acid →1000 ml water
- Mobile phase: Prepare a mixture of 90 volume of Buffer and 10 volumes of Acetonitrile. Filter through 0.45 µm filter and degas before use.

(A) Clofarabine standard preparation:

Transfer an accurately weighed quantity of about 10 mg Clofarabine working standard in to 100 ml volumetric flask, dissolve and diluted up mark with Mobile phase (100µg/ml)

(B) Preparation of working standard solution:

 From the above prepared stock solution of drug (100 µg/ml Clofarabine), take 1.5 ml of that solution and dilute u to 10 ml with mobile phase. This gave concentration of 15 µg/ml Clofarabine.

(C) Preparation of Sample standard stock solution of Clofarabine

Weighed accurately Clofarabine (10 ml) were transferred into 100 ml volumetric flask and dissolved in mobile phase to give a stock solution 100 µg/ml of Clofarabine. Stock solution (1.5 ml) was transferred in 10 ml volumetric flask and diluted up to mark with mobile phase to obtain working standard solution 15 µg/ml of Clofarabine and this solution was used to prepare standard solution for linearity.

RESULT AND DISCUSSION

Identification of Drugs:

Melting Point Determination

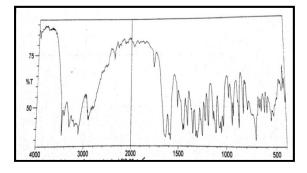

Melting point of the APIs were determined by using melting point apparatus. The observed melting points of APIs were compared with the reported melting point.

Table 2: Melting point determination

Name of	Reported Melting	Observed
Drug	Point	Melting Point
Clofarabine	216-256 [°] C	232-244 C

Infrared Spectroscopy

IR spectrum of Clofarabine were taken by KBr

Solubility Determination

The solubility of Clofarabine were checked in

Table 4: Solubility determination of Clofarabine

Sr No.	Drug	Reported	Observed
1	Clofarabine	Water : Slightly soluble in water Methanol : Sparingly soluble in Methanol Dimethyl Sulphoxide : Soluble in Dimethyl Sulphoxide	Complies with Reported solubility

various solvents like distilled water, methanol, and Dimethyl Sulphoxide etc. The results are shown in Table 4.

METHOD DEVELOPMENT

Selection of wavelength

Scan the standard solution and test solution on UV/Visible spectrophotometer, over the spectral range 200 to 400 nm. Use diluent as blank. The UV spectrum of the test solution should exhibit maxima at the same wavelength

A) Standard preparation

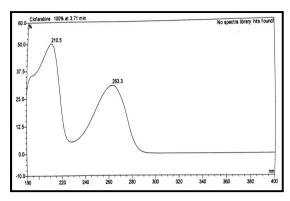

Fig. 3 Uv Spectrum of Clofarabine Standard solution showing selection of wavelength detection

Development trials:

(±2 nm) as that of a standard solution. Clofarabine show reasonably good response at 263 nm.

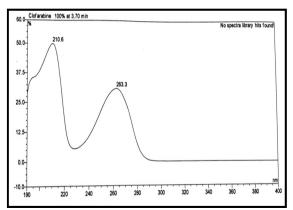

Fig. 4 UvSpectrum of Clofarabine Assay preparation showing selection of wavelength detection

Selection of Mobile Phase

To optimize the RP-HPLC parameters, several mobile phase compositions were tried. A satisfactory separation and good peak symmetry for Clofarabine was obtained with a mobile phase Buffer (1 ml Glacial acetic acid in 100 ml of water) : Acetonitrile (85:15) at a flow rate of 1.0 mL/min

Sr. No.	Mobile Phase	Ratio	Retention Time (min)	Remarks
1	Water : Methanol	60 : 40		No peak was Observed
2	Buffer : Acetonitrile	65 : 35	2.945	Peak shape was not satisfactory and fronting observed.
3	Buffer : Acetonitrile	70 : 30	0.847	Peak shape was not satisfactory and Tailing observed.
4	Buffer : Acetonitrile	85 : 15	4.663	Peak shape was not satisfactory
5	Buffer : Acetonitrile	90 : 10	3.706	Peak was sharp and symmetric

Observation:

After considering the varying combinations of various mobile phases, Buffer: Acetonitrile (90:10)%v/v was finalized as it was showing good peak shapes and a significant amount of resolution.
